Synthetic Systematic Review Gamma: A Fabricated Example Document

Abstract

A synthetic systematic review generated for software testing. It reviews imaginary studies that do not exist.

Search Strategy

The fabricated search strategy of this synthetic review describes searching three invented bibliographic databases between fictional dates, retrieving 1,182 imaginary records.

After fabricated de-duplication, 74 invented full texts were assessed in this fictional workflow and 19 imaginary studies were included.

Evidence Synthesis

The synthetic evidence summary states that, across the 19 imaginary included studies, the fabricated pooled effect estimate was 0.83 with an invented 95 percent interval of 0.71 to 0.97.

Fictional heterogeneity was described as moderate, with an invented I-squared value of 46 percent.

The evidence supporting the fabricated conclusion of this synthetic review is described as being of low to moderate invented certainty.

Limitations and Future Directions

Fabricated limitations of this synthetic review include invented publication bias, fictional inconsistency in how the imaginary outcome was defined, and made-up variation in fictional follow-up duration.

Future research proposed in this synthetic document includes fabricated standardisation of the invented outcome definition and imaginary individual-participant-data meta-analysis.
